

# Basic Programs for Animation Making

Just a small guide and collective resource of links or programs to google to help get people started into animation making!

- [The List](#)

# The List

## OUTSIDE OF GAME (Not a plugin!)

### **-Blender**

The very basic thing needed. It'll be needed for all sorts of modding things unless you have fancy paid tools to do it with instead. Highly recommend learning it all in blender!

**Link:** <https://www.blender.org/download/>

### **-Texttools**

A great method for modding and such. If you want to place animations into it you'll need to know the paths themselves. Just go to

Tools > File Operations > Import File

In order to import any pap you've made. It can also export the very same way and is a great way to extract paps even from mods if you import the mod first! Just do the same process as before with a small change

Tools > File operations > Export File!

**Link:** [https://github.com/TextTools/FFXIV\\_TextTools\\_UI](https://github.com/TextTools/FFXIV_TextTools_UI)

### **-XAT**

Very useful for checking animations outside of launching the game.

Also practically required to make animations using blender!

**Link:** <https://github.com/Etheirys/XAT>

### **-FFXIV Explorer**

Extremely useful for finding different paths. The public official version is sadly missing a lot from its resource section. Namely after stormblood but you can find better filled out lists from other mod makers and even on different forks. Typically this is most useful for beginners and will end up rarely used by people who have done it for longer times but it remains useful throughout.

Fact its not a plugin is also quite the plus! Just remember to load file 040000!

**Link:** <https://github.com/goaaats/ffxiv-explorer-fork>

### **-(For 3ds Max) Multi Assist**

While XAT supposedly works with HKX's as well. I've noticed it being a great deal more complicated to get working right. Multi-assist is fantastic at working with HKX's though doesn't have all the bells and whistles that XAT has. If you have any issues with animations not exporting quiiiite right from 3ds max. Use this!

Bonus fact. Using Multi Assist and XAT interchangably works as a wonderful global converter. Once an animation is a pap it can easily be extracted as either an HKX from Multiassist or an FBX from XAT for their respective best programs! Multitassist=3ds | XAT=Blender

**Link:** <https://github.com/ilmheg/MultiAssist>

## **NOW FOR THE PLUGINS!**

### **-Quick XIV Launcher (Not a plugin but required for them)**

The basis of all plugins. Its required for any of them to work and I highly recommend getting them up and running if your wanting to animation mod. Its not required but it'll make the process SO much easier

**Link:** <https://github.com/goatcorp/FFXIVQuickLauncher>

### **-Penumbra**

A basic mod that lets you add and remove mods on the fly. I shouldn't need to say more on just how helpful this will be towards making animations!

**Repo:** <https://raw.githubusercontent.com/Ottermandias/SeaOfStars/main/repo.json>

### **-Glamourer**

This attaches to and requires Penumbra to work. It allows you to switch your characters clothing but more importantly your race and gender. Exceptionally useful for testing, invaluable even. I'd consider it as close to required as you can get without it being LITTERALLY required.

**Repo:** <https://raw.githubusercontent.com/Ottermandias/SeaOfStars/main/repo.json>

### **-VFXEdit**

A FANTASTIC MULTI TOOL. It says simply vfx and is borderline required to be able to properly mess with vfx on your animations but its also useful for pap editing... tmb messing(Be careful with these) even skeletons... its a fantastic multitool with a somewhat misleading name!

**Repo: Literally on the dalamud plugins list. Its a first party plugin!**

-----

I'll add other links and snippets for other tools as I either remember them or otherwise find new ones! I may even write down extreme beginners guides to many of these tools to go over the very very basics!
