

# Skirt Physics

If you have made it this far.... welcome to the pits of skirt physics hell (mostly joking). FFXIV skirt physics is a bit of a pain to deal with. To achieve flowy skirt physics like you see in MMD videos, you ideally need a lot of skirt bones to work with.

MMD Skirt Bones:

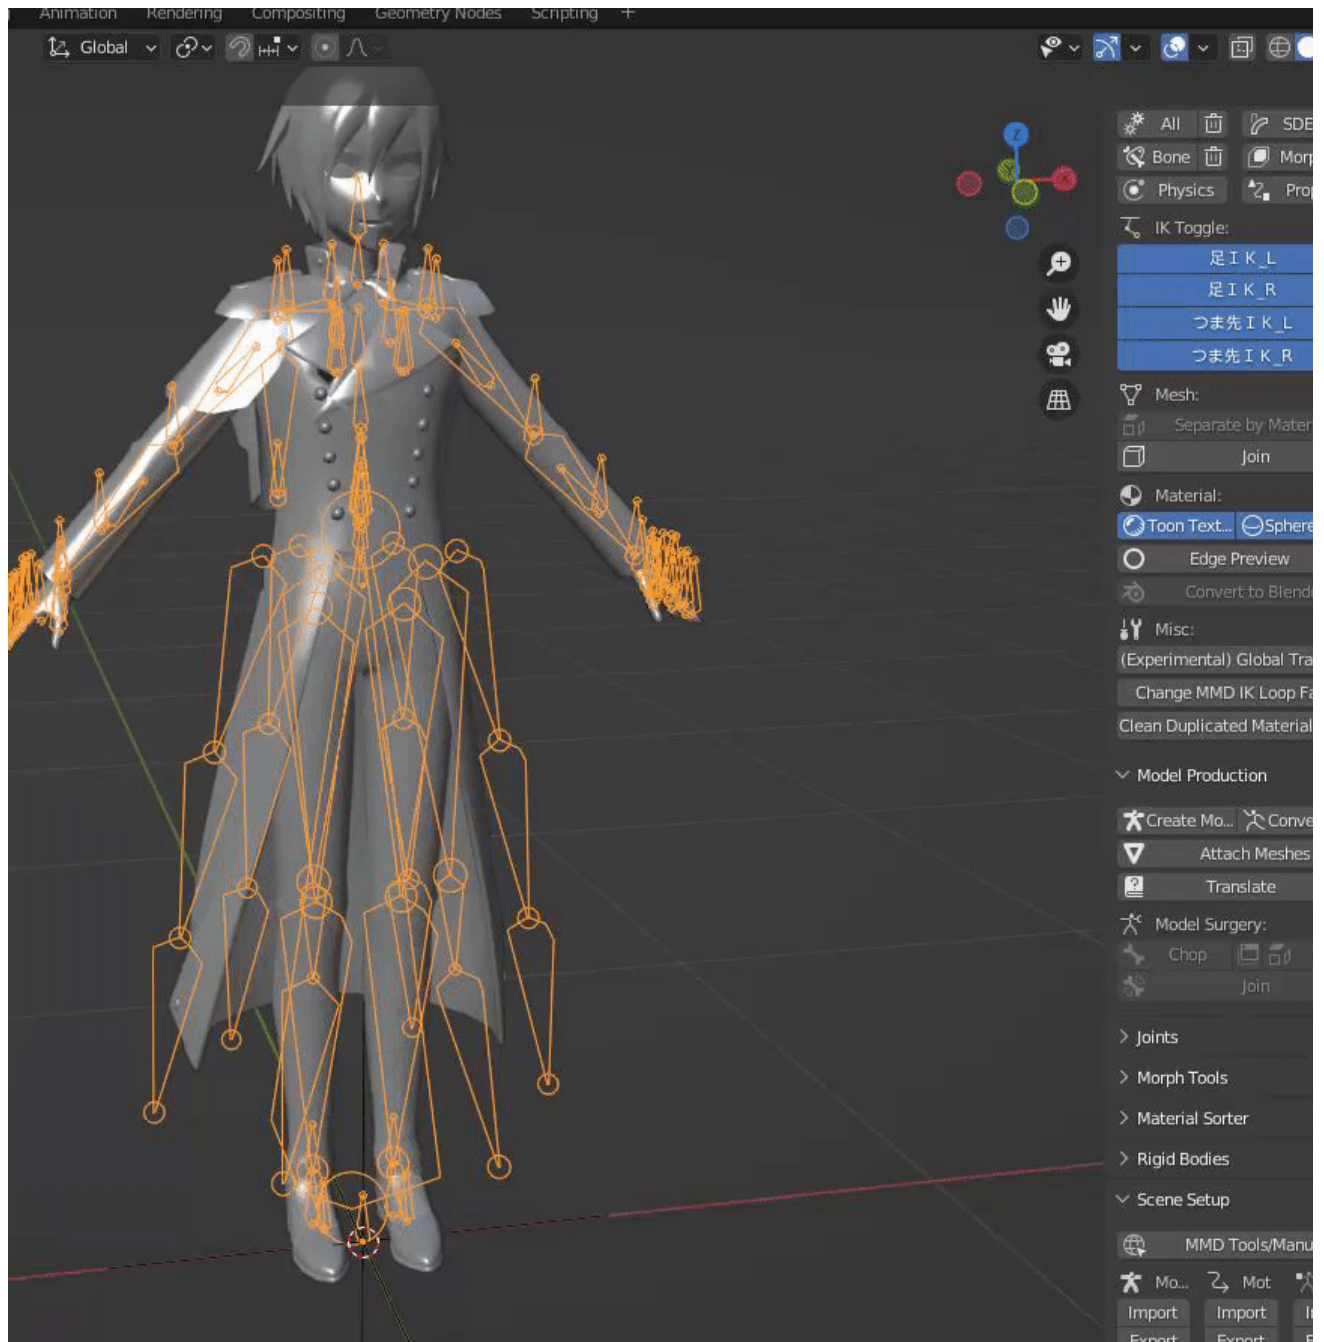

FFXIV Skirt Bones:

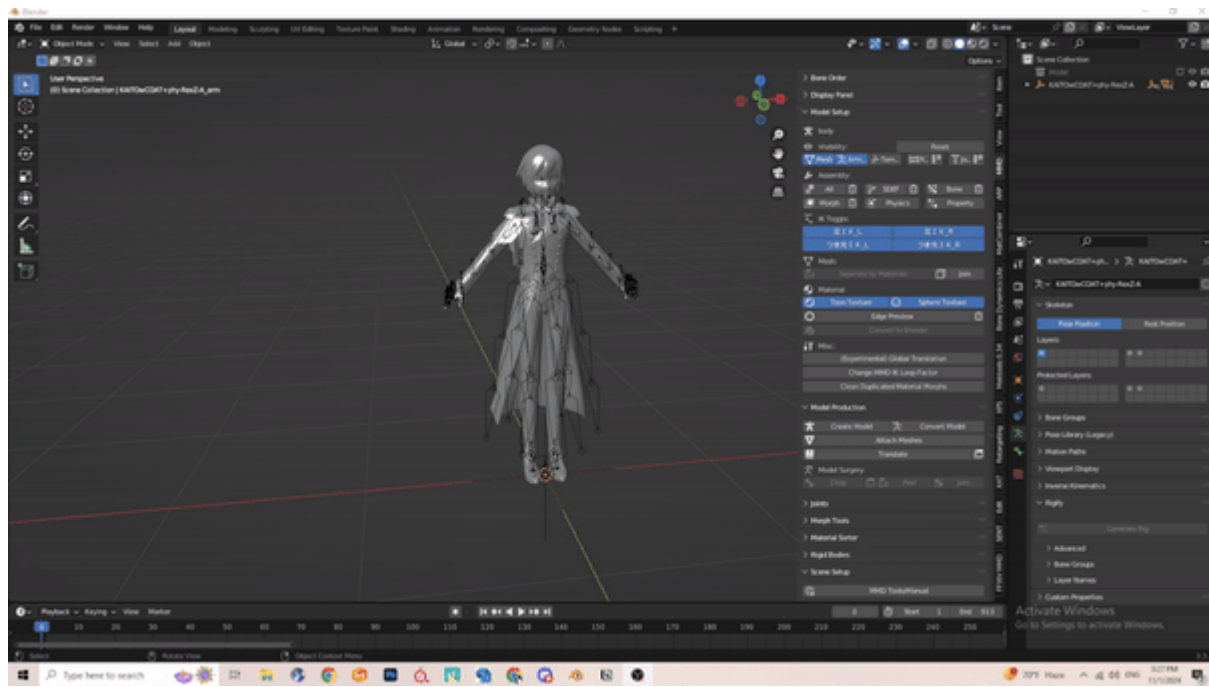

**Big credits to RexZ for adjusting the kaito MMD model to match ffxiv's skirt bones! Major life saver ngl.**

1. Load in your MMD model as shown in Chapter 1.
2. Before you start, navigate to the Scene Set up section. In the Rigid Body section, click on the Update World button.

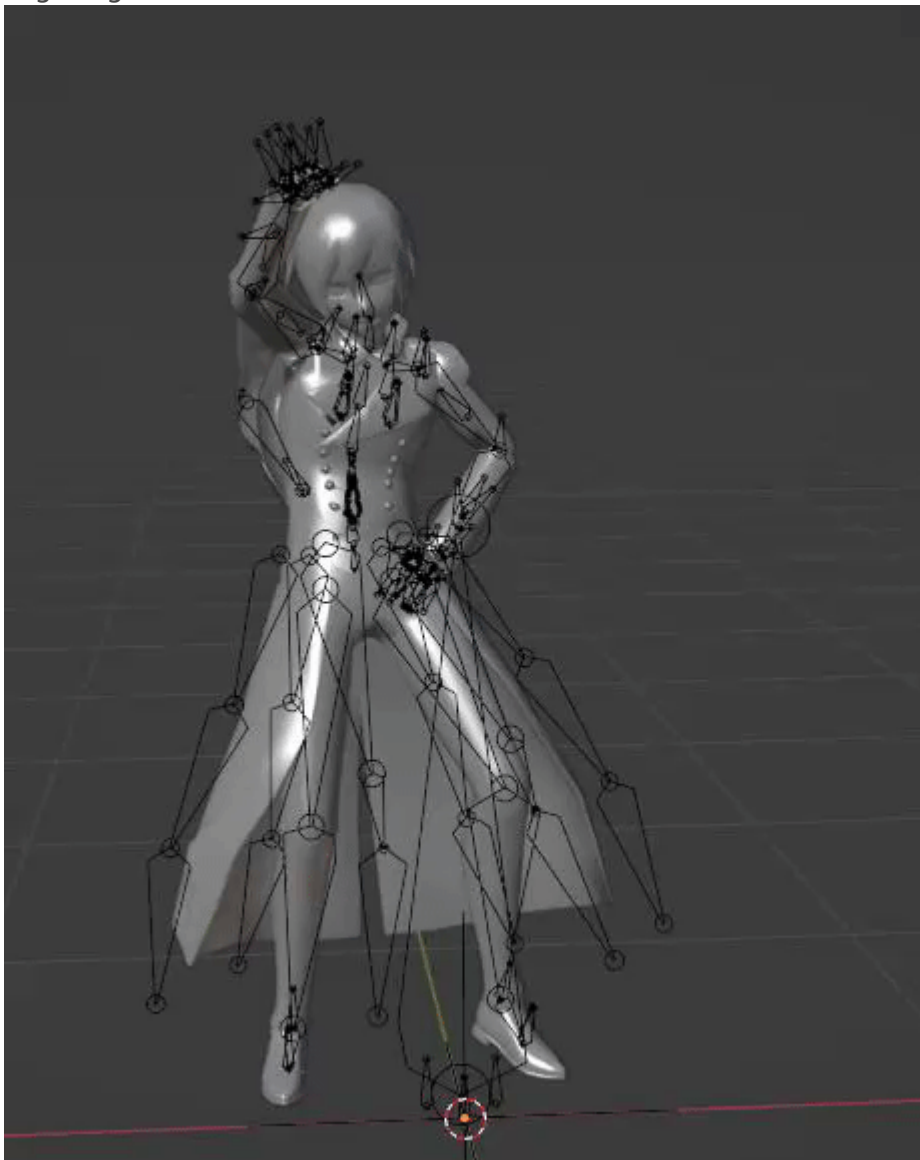

3. Select the MMD model's armature and import your motion. Remember at the same scale you imported the model at.

To enable physics, have the MMD model's armature selected and find the Model set up section. In the assembly, click on the physics button.

4. Now depending on the motion you are working with, default parameters should be fine.

- Example here is See Tinh. Motion isn't too drastic, so it should be good for retargeting

- Now for motions that have really drastic movement, those will require changes in the parameters.

- 2 examples: Erase or Zero and Geddan
